STEELDOOR

Tree patterns in nature are processed one-on-one into metal cylinders. After this process, a cylindrical metal mold with a processed tree pattern appears. A separate cylinder is required for each pattern. Then, the coloring process is performed on the special base papers by means of these rollers. Decor paper with a tree pattern and different colors comes out in the middle.

Decor papers gain strength by going through various processes on impregnation lines. The most important process that separates the Melamine Door from the foil door and makes it long-lasting is the impregnation of the decor paper.

As the final production stage, impregnated decor papers are pressed on hdf plates with high density and special surface abrasives with presses that can reach high pressure and heat values and fixed to the hdf surface. During this process, products with adhesive properties such as glue are not used. Heat and high pressure are the most important elements here.
